

Homework Week 12

Garrhet Sampson

April 5th, 2021

TinkerCad Circuits seems like it would be a perfect tool for electrical engineers as they would be able to create and model electrical wiring. Thankfully that's not something I plan on using in the future but I can see how someone in that field would find it very useful. What I found particularly interesting is that you are able to set and measure the electrical wattage for each input and battery.

Code Blocks is also super useful. I remember using it last semester in Creative Coding 1 but being able to visually see the code that you are inputting into the process is a great way to organize and learn basic coding. As someone that tends to move more toward the visual side of design in UX/UI design I like using more visual coding software as it works more naturally with my graphic design programs that I make for the program.
